LEARNING DIARY, MOBILE MODULE

19.5.2026

Checked the general information of the course and went through the requirements. Set up my environment with github and Android Studio. Started the exercises and finished the first video and exercise. I have done the Java programming course, so this was pretty familiar.

Continued to the second video. This was pretty straightforward as well, got my memory refreshed on the “intent” parts.

Finished third video also. Setting the right pictures when clicking the vegetables on the list was pretty complicated but I think I got it. Now I still need to think about what I want to do on the project, but I think I am going to leave it for later.

20.5.2026

For the course project I am building a habit tracker app. I used the exercise code as a boilerplate and started adding / modifying to it. The app has three screens: a main habit list screen, an add habit screen and a detail screen. The main screen uses a listview with custom adapter (habitadapter) to display each habit as a card with a name, category,

checkbox and a streak counter. Tapping a habit opens the detail screen, which shows the habit's information and streak and allows the user to delete it. The add screen has a text field for the habit name and a spinner dropdown for selecting a category, with a save button that returns the user to the main list.

Navigation is done by using intents. To pass data between activities, I used `putExtra` and `getIntentExtra` to send the habits index from `secondactivity` to `detailactivity`. I also used `onResume()` in the main screen to refresh the list whenever the user returns from another screen.

For data storage I kept things pretty simple by using a static `HabitManager` class that holds the habit list in memory for the duration of the app session. Each habit is represented by a `Habit` class with fields for name, category, streak and whether it was completed. One challenge I ran into was that the checkbox inside each listview row was intercepting taps, preventing a row click listener from firing. I fixed this by setting `focusable` to `false` on the checkbox.
